

SOES 3042/6025 – Assignment 1 Marking Criteria

This assignment is marked out of 40

For SOES3042:

- Problem 1: 20 marks
- Problem 2: 20 marks

For SOES6025:

- Problem 1: 18 marks
- Problem 2: 22 marks, including the model-selection component

Marks are awarded for the student's ability to critically evaluate the AI-generated report. Credit is given for identifying specific technical errors, explaining why they are wrong, and, where appropriate, showing corrected calculations or figures as evidence.

Students should not receive credit for comments that focus only on grammar, wording, formatting, or general style. The main basis for marking is the accuracy and depth of the technical critique.

For each problem, marks should reflect:

- identification of errors in data processing, anomaly calculation, statistical testing, EOF analysis, regression, model selection, or figure interpretation;
- explanation of why each identified issue is scientifically, mathematically, or statistically incorrect;
- statement of the correct method, assumption, or interpretation;
- use of corrected figures or calculations to support the critique;
- concise prioritisation of major technical errors within the page limit.

A polished critique that misses key technical errors should receive limited credit. A concise critique that identifies the major methodological, statistical, and graphical errors should receive high credit.
